Surgical Pathology Report	

SPECIMEN SOURCE:

A. APPENDIX

CLINICAL HISTORY:

29-year-old male with appendicitis

(The above clinical history has been transcribed from the information written on the requisition sheet provided by your office. Please notify us immediately for misinterpretation or errors).

DIAGNOSIS:

Appendix, appendectomy Appendix with polypoid low grade appendiceal neoplasm arising in a background of granulomatous appendicitis. The resection margin is negative for dysplasia.

Note Additional sections are pending.

Stephen Ward, M.D., PhD  
Attending Pathologist  
Ln

GROSS DESCRIPTION:

The specimen labeled "Appendix" is received in formalin and consists of a 9.0 x 2.0 cylindrical appendix with a tan-pink and congested serosa partially covered by exudates. Also identified is an attached 6.0 x 1.5 x 0.5 cm focally hemorrhagic mesoappendix. The staple line resection margin is inked black and the specimen is sectioned to reveal a 1.0 cm lumen and 0.5 cm wall. The lumen contains tan-brown material. No site of rupture is grossly identified. The specimen is submitted
